

December, 2020

Monthly Progress Report

The water department ended the year with approximately 170 repairs to the system and 91 new water service taps.

Did You Know?

In the colder months, especially when temperatures are below freezing, we have the potential for a significant increase in water main breaks. One of the main reasons for this is when the ground freezes, it expands, causing more pressure to be put on the pipes below ground (in some cases it can double).

Upcoming Projects

The holding tank at 1 park is getting a new mixing system installed this month. This will help to keep the water at its freshest to insure quality water at your tap!
